PRIORITY APPLN. INFO.: RD 2001-452061 20011210

AB New herbicidal compns. have been found which are suitable for controlling a broad range of weeds in cultures of useful plants, in particular wheat or corn. Both monocot and dicot weeds may be controlled with the use of these compns. The compns. are suitable for use on both unmodified crops and those that are either naturally herbicide tolerant or have been modified to be tolerant to one or both of the herbicides in the compns. The compns. contain, beside standard formulation materials such as diluents, surfactants or adjuvants, a mixture of active ingredients comprising (1) 2-(2'-nitro-4'-methylethylsulfonylbenzoyl)-1,3-cyclohexane dione (mesotrione) and (2) a herbicidally effective amount of at least one further co-herbicide selected from the group consisting of bromoxynil, fluthiacet-Me, EPTC, halosulfuron-Me, clopyralid, diflufenzopyr, flumiclorac-pentyl, 2,4-D, bentazone, carfentrazone-Et, fluroxypyr, isoxaflutole, isoxachlortole, metosulam, sethoxydim, sulfentrazone, thifensulfuron-Me, cyanazine, fentrazamide, MCPA, MCPB, MCPP, mecoprop, metobenzuron, pethoxamid, profluzol and sulcotrione, isoxaflutole. The compns. can be used in a method for selectively controlling broadleaf weeds in useful plant cultures, in particular wheat or corn, which method comprises treating the useful plants, their seeds or a locus thereof at the same time or successively with mesotrione and the co-herbicide listed - above. The application rate is usually between 0.001 to 2.0 kg/ha of mesotrione, preferably from 0.005 to 1 kg/ha, and between 0.001 to 2.0 kg/ha of coherbicide, preferably 0.005 to 1 kg/ha. For application to the crops, the compns. of mesotrione with the co-herbicides may be applied together with the additives in formulations such as emulsion concs., brushable pastes, directly sprayable or dilutable solns., diluted emulsions, wettable powders, soluble powders, dusts, granules, or **capsules**. The compns. may also contain further additives such as stabilizers, antifoaming agents, viscosity modulators, as well as a safener, a further herbicide, a fungicide or an insecticide, or fertilizers or other active substances for achievement of special effects.

AB The object of the invention is an active-substance vector multiparticulate system comprising one or several active substances enclosed in a hydrophilic organic matrix comprising at least one hydrosol. and/or hydrodispersible anionic polymer which is precipitated by metallic cations. Typical active substances are perfumes used in detergents and agrochems. Thus, homogenizing a dispersion containing 20 g di-Me 5-sodiosulfoisophthalate-di-Me terephthalate-ethylene glycol-isophthalic acid copolymer (I, mol. weight 60,000-65,000) and 80 g water with a dispersion containing 500 g I and Eagle 3000 (liquid perfume), spraying the mixture in to a 0.1 M CaCl₂ solution, filtering, and drying as a fluidized bed 30 min at 37° gave a white powder.

AB A method of producing lignin-based matrix microparticles for the controlled release of an agricultural active includes forming an emulsion of an organic solution in an aqueous solution, wherein the organic solution contains a lignin derivative and an agricultural active in a volatile organic solvent and the aqueous solution contains an emulsifier; and removing the organic solvent, thereby producing microparticles having a matrix comprising the lignin derivative within which the agricultural active is distributed. Small, spherical lignin-based matrix microparticles that release an agricultural active at

a controlled rate are described, as are plants and plant propagation materials that are treated with such microparticles.

AB A review. Results of the residue behavior of herbicides, growth regulators and safeners which were submitted in the national authorization procedure at the biol. research center of agriculture and forestry for the first time during the past ten years are presented comparatively. Active ingredients of the second half of the nineties are included as, new compds." in the evaluation procedure of the EU for inclusion in Annex I of the Directive 91/414/EC. The residue level in crops of treated plants basically depends on several factors which are, in particular, kind of uptake and distribution, speed of degradation processes in and on those plants, dilution of present residues by mass growth of the plants, and the application rate of the active compound per ha. It is shown in general that low residue levels are reached at harvest at the latest or in many cases no residues of the herbicides considered are detectable. Residue values determined in certain matrixes are not directly related to the application rates in each case. Rather more important in this connection are application conditions, kind of uptake and distribution within the plant. In this respect, no new results are obvious compared to the properties of herbicides which are in use for several decades. However, it can be

emphasized that most of the new active ingredients are applied in significantly lower rates than the average of common herbicides.

- AB The unsym. ketones (e.g., Me cyclopropyl ketone), useful as intermediates for numerous special chems. such as herbicidal or other agricultural compds, are continuously prepared by passing raw materials containing first acids (e.g., acetic acid), or aldehydes or their derivs., and second carboxy acids (e.g., cyclopropanecarboxylic acid) in the ratio 1:2 to 1:20 through a plurality of tube reactors, each having an inlet, an outlet and a catalytic bed (loaded catalysts, e.g., CeO₂ and Al₂O₃) between inlet and outlet, at 350-500° and weight hourly space velocities ≥2; and separating the ketone.

AB The development of an estimator for vapor pressure based upon organic functional groups is described. This vapor pressure calculator permits prediction of vapor pressure for a wide range of structural classes. The statistical quality of the derived coeffs. is presented as well as the quality of the prediction of the training set of compds. The calculator is then used to predict the vapor pressure of recently introduced **agrochems.** to illustrate its performance. The significance of this calculator is that the **agrochem.** scientist can readily estimate the effects on vapor pressure of altering specific structural features of a mol.

AB The title compds. I [R = H, CO₂R₅; R₅ = (un)branched (un)substituted C_≤6 alkyl; R₁ = Me, iso-Pr, cyclopropyl, 1-methylcyclopropyl; R₂ = S(O)_nR₅₁; R₅₁ = (un)branched C_≤4 alkyl; R₃ = Cl, Br, F, (un)branched (un)substituted C_≤4 alkyl or alkoxy, C_≤6 alkenyl, etc.; R₄ = Cl, Br, F, (un)branched (un)substituted C_≤4 alkyl, C_≤4 alkoxy substituted by ≥1 halogen atom(s), CN, etc.; n = 0-2], useful as herbicides for weed control (no data), are prepared and I-containing **agrochem.** formulations presented. Thus, 3-cyclopropyl-1-[3,4-difluoro-2-(methylsulfonyl)phenyl]-2-ethoxymethylenepropane-1,3-dione was cyclized with hydroxylamine hydrochloride, producing 5-cyclopropyl-4-[3,4-difluoro-2-(methylsulfonyl)benzoyl]isoxazole, m.p. 115-118°.

TITLE: The mode of action of isoxaflutole II.
 Characterization of the inhibition of carrot
 4-hydroxyphenylpyruvate dioxygenase by the
 diketone nitrile derivative of isoxaflutole

AB Isoxaflutole is a novel herbicide for broadleaf and grass weed **control** in corn and sugarcane which acts by inhibiting 4-hydroxyphenylpyruvate dioxygenase (HPPD). In plants and soil, isoxaflutole is rapidly converted to a diketonitrile derivative (DKN) which is the active herbicide principle. The kinetics of inhibition of carrot HPPD in vitro by the DKN showed that it is a potent tight-binding inhibitor ($IC_{50} 4.9 \pm 0.2$ nM), exhibiting a time-dependent interactions with the enzyme in its ferrous state. DKN is a competitive inhibitor that rapidly inactivates the enzyme (with a constant rate of association of 0.2 ± 0.004 μ M⁻¹s⁻¹) by forming a reversible complex that **releases** slowly the inhibitor in an unmodified form. The decarboxylation coupled with reduction of mol. oxygen is accepted as the first enzymic event of the HPPD-catalyzed reaction which occurs as 4-hydroxyphenylpyruvate binds to the internal iron of protein via its keto acid function. The DKN of isoxaflutole presents a β -(1.3)-diketone moiety, a delocalized π system which can mimic the keto acid functionality of the substrate and which is also well known for its iron-chelating properties. Since this inhibitor competes with the substrate for binding, it is highly probable that it chelates the ferrous iron in the active site strongly by forming a stable ion-dipole charge transfer complex that resembles the initial substrate-iron complex or an early reaction intermediate. The slow **release** of the inhibitor in an unmodified form also suggests that the mol. oxygen activation due to ferrous iron generating a powerful oxidant as the inhibitor-enzyme complex form is probably not occurring.
